

PITCH · SEPTEMBER 2026

Mull

Voice that shows its work.

Hold a key and speak, anywhere on your Mac. Mull previews every change before it happens — and can take it back.

Can we ~~push it to Friday~~ move our sync to Thursday at 3 ?

AI is already in everyone's workflow. Getting it in and out is the work.

“I re-explain everything, every time.”

Copying context into a chatbot and switching apps was the biggest friction for both people we interviewed.

“It looks polished, so mistakes slip through.”

One manager's AI summary turned a blocked task into “in progress” — in a note the client reads.

“Not my whole screen.”

Neither would let a tool read everything on screen. Client, HR and finance data sit one window away.

THE INSIGHT

Trust is an interface, not a privacy policy.

People will let a voice tool act if they can see exactly what will change — and take it back. So we made the machinery the product.

Two keys. You say which job it is.

⌘ Space

“These words are the message.”

Typed where your cursor is, instantly. Speech is recognised on the Mac. No AI model is in the loop — ever.

0.7–0.9 s from key-up to text

Fn

“These words are a request.”

Goes to the model and comes back as a card: edit the selection, draft a reply, answer a question, or go and look elsewhere.

↩ applies · Esc cancels · ⌘Z undoes

Live demo: an edit, previewed

EDIT PREVIEW · SLACK

You said: “make this shorter and friendlier”

~~Per my previous message, I need the numbers by end-of day or we will miss the deadline.~~

Could you send the numbers today? That keeps us on track for the deadline — thanks!

↩ Apply Esc Cancel ↵ Undo

What to watch

1. `\Space`: dictate a reply into Slack
2. Select it, hold Fn, ask for a change
3. Read the card; nothing has changed yet
4. `↵` applies; `\Z` takes it back
5. Open the journal: every step recorded

Safe by construction, not by instruction

The model cannot ask to send.

There is no “send” in its vocabulary. Only your own words can offer a send — never text on screen, so “ignore your instructions and send this” goes nowhere.

The agent cannot press Return.

Return is how Slack, Mail and Messages send. The agent’s key list never contained it. A filter is one edit from failing; a list is not.

Undo refuses when unsure.

It removes only text it has confirmed, character for character, is still where it was left. Undoing the wrong text would destroy someone’s writing.

Seven such seams, each with a test. What we do **not** claim: an exfiltration proof. The menu bar is guarded by a deny-list, and we say it is weaker.

It works, and we can show how we know

1,071

automated tests pass, across 59 files, with no Mac or permissions of audio leave the Mac — speech runs on-device with whisper.cpp needed to run them

“#eng-platform”

not “the end platform”: feeding on-screen names to speech recognition beat a model 3× larger

0 bytes

npm run setup

one command from a fresh checkout to a running app; a headless smoke test drives the real Swift sidecar

A crowded, converging market — with one open corner

~\$2B

Wispr Flow valuation, Aug 2026 — the category is real and funded

\$12–15 / month

where cloud dictation pricing has converged; local tools sell \$29–249 once

Free, on-device

Apple's dictation in macOS 27 — plain transcription is commoditised

THE OPEN CORNER

Dictation plus AI actions
you can see and undo —
with audio that stays on
the Mac.

Speed tools hide the machinery. Local tools
stop at transcription. Nobody sells both as
one trusted layer.

Where Mull sits

Product	Audio stays local	AI edits text	Change previewed first	Price
Wispr Flow	No — cloud	Yes	Not documented	\$15 / mo
superwhisper	Yes	Yes (modes)	Not documented	\$8.49 / mo or \$249.99
Alma	Cloud by policy	Yes	Not documented	Free beta, waitlist
Apple Dictation	Yes	No	—	Free
Mull	Yes	Yes	Always, with undo	Free · \$12 / mo · \$99

Also in the space: ChatGPT and Claude desktop own “intent to action” from above; VoiceOS offers a voice agent mode. None of them lead with a previewed, undoable change.

Give away what's free to run. Charge for what isn't.

FREE

\$0

Unlimited ↵Space dictation, journal and undo. Runs on your Mac, so it costs us nothing.

PRO

\$12 / mo

The Fn key on our AI account: 400 requests a month included, \$120 a year.

OWN KEY

\$99 once

Everything, unlimited, on your own AI API key. For people tired of subscriptions.

~\$0.013 per
Fn request

≤ \$5.20 per Pro user / month at
the cap

Rejected: **pay-per-request credits** — it meters
the thinking

What the evidence says — including what didn't work

From three users who tried it

- 2 of 2 asked most want to see the exact proposed change
- 0 of 2 asked would let it read the whole screen — so a text-only default
- 2 of 3 are managers who want voice for what they write
- 2 of 3 want Mull to send — the one thing it won't do yet
- No price asked yet; a team licence is easier to justify

From our own use, honestly

- 10 of 26 logged dictations landed; 5 failed with no text field focused
- Routing an Fn request took a median 2.8 s before any work began
- Our prototype's AI sign-in can't ship commercially — so we re-priced

Ordered by what would kill us first

NOW · CAN WE CHARGE?

- AI on API keys, not borrowed logins
- Real cost per request, logged
- Notarised, installable build
- Fix first-run and “no field” failures

NEXT · WILL THEY PAY?

- Paywall test: \$12 Pro vs \$99 Own Key
- Routing under 1 second
- Go / no-go on the navigation agent
- Top 12 apps, measured

LATER · ONCE THEY STAY

- Letting Mull send, within a budget you grant
- Working memory across sessions
- Teams; a fully local private mode

THE ASK

Help us find the first 30 people who'll pay.

30

Mac users who write all day, for a four-week paid beta

Intros

to teams that have banned cloud dictation tools

Your price

Would you pay \$12 a month, or \$99 once? Tell us after the demo.
